ACTIVE DIRECTIONAL ANTENNA
HE 100

701.5002

Bestell-Nr./Order No.: 652.1803.02

The Active Directional Antenna HE 100 from Rohde & Schwarz meets all the requirements a modern, hand-held DF antenna should fulfil:

- Unambiguous determination of direction of incidence, i.e. distinct directional pattern
- Antenna voltage maximum as direction criterion (maximum-signal DF method)
- Handy size, in particular minimum crosswise dimensions, and low weight
- Suitability for vertically and horizontally polarized signals
- Wide dynamic range due to selectable sensitivity permitting use even in extremely intense electromagnetic fields
- Low current drain

1 Uses

Due to its small size and low weight, the Active Directional Antenna HE 100 in conjunction with a compact, portable receiver (e.g. EB 100) is ideally suited for tracing signal sources and sources of interference.

The direction of the signal source is found by pointing the antenna towards the direction of maximum signal voltage. The overall frequency range from 20 to 1000 MHz is covered by three exchangeable antenna modules, which handle both vertically and horizontally polarized signals and have almost identical cardioid radiation patterns in both planes.

In order to increase the sensitivity, a low-noise amplifier can be switched into circuit (active/passive switchover). As this amplifier is bypassed during passive operation, the HE 100 can also be used in the vicinity of powerful transmitters.

Camouflaged use of the antenna, for instance in a suitcase or a travelling bag, is also possible.

2 Description

The broadband, cardioid directional pattern of the HE 100 is obtained by using loaded loop antenna modules of different size for the three subranges of 20 to 200 MHz, 200 to 500 MHz and 500 to 1000 MHz. These RF modules can be plugged on to a handle, which contains the following:

- Power supply, which comes from a set of four round cells R6 (dry or NiCd cells) contained in a removable battery holder.
- Antenna electronics, comprising RF amplifier, active/passive switch and circuitry for the meter.

In the active mode, the RF signal path is taken via an RF relay (when supply voltage is switched on) to the low-noise amplifier, which is bypassed in the passive mode.

- Meter, which indicates the strength of the incoming signal. The pointer deflection is controlled by the receiver via the RF cable. The meter, which can be illuminated, also indicates the state of the batteries at the push of a button.

3 Operation

(see drawing 701.5002.01)

a) Replacing RF modules:

Release catch by pressing two studs (2) and pull out RF module.

Plug in required RF module until it locks in position.

b) Active/passive switchover:

Select the desired mode by means of pushbutton (3).

c) Meter indication of state of battery:

Press pushbutton (8) for the battery test on the meter; red marking: battery discharged.

d) Meter illumination:

The illumination is switched on by pressing pushbutton (4).

e) Replacing battery:

Open the cover (7) of the battery compartment and replace batteries in holder.

4 Practical Hints

In order to obtain optimum results, hold the antenna with the arm fully stretched out to find the signal maximum. The centre of rotation should go through the antenna (see Fig. 1) to make sure that any variations in signal strength caused by disturbances of the electromagnetic field due to local influences do not impair the measurement.

If it is not possible to find a pronounced maximum, the effect of reflections is too great. Such reflections or interference are caused whenever electromagnetic waves hit large objects with a high dielectric constant or good electrical conductivity.

It is advisable to take bearings from several points, gradually coming closer to the transmitter (see Fig. 2).

5 Specifications

5.1 Electrical Specifiations

Frequency range	20 to 1000 MHz covered by three RF modules:
	20 to 200 MHz with RF module 701.5702
	(50) 200 to 500 MHz with RF module 701.5354
	(100) 500 to 1000 MHz with RF module 701.5554
	The extended frequency ranges specified in parentheses are covered with reduced sensitivity.
Characteristic impedance	50 Ω
RF connector	BNC
Power supply (contained in handle)	four dry cells R6 1.5 V *)
Current drain	Dry cells (6 V) Passive operation 0 mA Active operation 47 mA Meter illumination 30 mA Battery test 120 mA
Antenna factor $K = 20 \log E/V_{out}$	see Fig. 3
Field-strength sensitivity (for receiver noise of 10 dB at bandwidth of 7.5 kHz)	see Fig. 4
Radiation patterns	H plane: cardioid E plane: cardioid see Fig. 5

*) The dry cells supplied with the HE 100 can be replaced by ordinary rechargeable NiCd cells (4 x 1.2 V, 0.5 Ah, size R6) with charger.

5.2 Mechanical Specifications

Resistance to vibration (in transport case)	DIN/IEC 68-2-6 (5 to 55 Hz, 0.2 mm amplitude)
Resistance to shock	DIN/IEC 68-2-27 (half sinus, 30 g, 11 ms)
Degree of protection	IP 54 (in position of use)

5.3 General Data

Dimensions	see drawing 701.5002.02
Transport dimensions	470 mm x 360 mm x 180 mm (outer dimensions of transport case)
Length of cable	1.2 m
Weight	handle with RF module 701.5554: approx. 0.8 kg 701.5354: approx. 0.8 kg 701.5702: approx. 1 kg
Total weight including transport case	4,5 kg
Operating temperature range . . .	-30 °C to +50 °C
Storage temperature range . . .	-30 °C to +60 °C

6 Equipment Supplied

	Order No.
Handle (containing power supply and display module)	701.5019
3 RF modules	701.5702 701.5354 701.5554
4 dry cells, size R6 (1.5 V)	
1 transport case	701.5860
1 manual	652.1803.02

7 Maintenance

If the batteries used are not leakage-proof, check the battery container at regular intervals.
