

# **POWER ANALYZER 3390**

Power measuring instruments

# Maximum accuracy of ±0.16% achieved with current sensors!

□ Measure the primary and secondary sides of inverters

Advanced motor analysis functions

Measure inverter noise

Large Assortment of Wide-band, High-Precision Feed-Through Current Sensors

HIOKI company overview, new products, environmental considerations and other information are available on our website.

# **Current Sensor Method**

## **Surpasses the Accuracy of Direct Connection Method**

When combined with the feed-through current sensors

For Current Sensor specifications, please go to

page 15

### Power Analyzing Control Engine Technology processes

Measurement data at high speeds and with excellent accuracy

## Weight & Volume

A HIOKI proprietary engine that takes advantage of the latest semi-conductor technologies enables a much smaller footprint than ever before (in comparison with other HIOKI high performance power meters)

# **Power Analyzer 3390**

Feed-through current sensors

Clamp-on sensors

9272-10

# Current sensor design allows for safe and efficient testing

- Choice of sensors include easy-to-measure AC and AC/DC clamp-on sensors and feed-through current sensors for high-accuracy measurements
- Immune to in-phase noise effects when measuring inverters

#### Basic accuracy of Model 3390: ±0.1% Basic measurement range: DC, 0.5 Hz to 5 kHz (Frequency bandwidth: DC, 0.5 Hz to 150 kHz)

#### Effective input range: 1% to 110%

- High accuracy, wide band, and wide dynamic range
- Also measure the secondary side of DC inverters
  - in conjunction with a variety of HIOKI current sensors

### All data updated at 50ms\*

- 50ms data refresh rate for all measurements unaffected by settings restraints
- Synchronize the measurements of multiple **3390**s Automatic update rate eliminates the need of switching for low-frequency measurements
- \* 50ms data refresh rate does not apply to waveform and noise analysis

### Meet the Needs of Alternative Energy and Inverter or Motor Evaluations

### 4-channel isolated input

## Measure the primary and secondary sides of inverters simultaneously

- Choose wiring from single-phase two-wire to three-phase four-wire
- Synchronize the measurements of multiple 3390s

- Connect up to four **3390**s and synchronize their clocks and measurement timing for multiple-channel measurements (using the SYNC terminal and Connection Cable **9683**)
- Use dedicated application software to conduct synchronized operations for up to 4 units and obtain all the measurement data

#### CF card interface

#### & USB memory interface

Automatically save interval measurement data to a CF card (When saving manually, measured data and waveform data can be saved directly to the CF card and USB memory)

#### Connect an External Thermometer

- Data from temperature measurements taken with an external thermometer aids in motor evaluation Connecting the **3440 SeriesTemperature HiTESTER** 
  - (via the RS-232C interface)

🕨 page 9

also allows temperature data to be collected simultaneously

3440 Series

#### Waveform Output and 16 Channel D/A output

- Use the **D/A OUTPUT OPTION 9792** to update data every 50ms and output up to 16 items in analog format
- Also output the voltage and current waveforms for each channel (using 1 to 8 channels)
- (Waveforms are output at 500 kS/s and sinusoidal waveforms can be represented accurately at up to 20 kHz)

# Ideal for Motor Evaluation and Analysis

• Use of the **MOTOR TESTING OPTION 9791 (or 9793)** allows torque meter output and rotation input, and facilitates motor power measurement

### For motor evaluation and analysis specifications,

#### A Variety of Interfaces Standardly Equipped

Includes 100Mbps Ethernet and USB 2.0 High Speed communications interfaces.

#### HTTP server function available with free dedicated PC software

- HTTP server function through web browser enables easy remote operation
- Free dedicated PC application can be downloaded from the HIOKI website

Collect data and operate the **3390** remotely by connecting it to a PC via LAN or USB page 11

# **Extra-Large Screen Expands Possibilities**

### Capture measured data and waveforms at a glance utilizing a variety of display options

### The 9" color LCD can display up to 32 data parameters

	y up to 52 uata parameters

### **Feed-through Current Sensor Enable Extremely Accurate Measurements**

HIOKI's high-performance feed-through current sensors absolutely minimizes the effects of conductor position and external fields, making them exceptionally precise. Repeatability and stability are absolutely unmatched!

at 100ADC input, when measuring a 10mm diameter wire

Feed-through current sensors meet a large variety of applications from electric or hybrid vehicle testing, inverter motor evaluations and solar power devices and fuel cell analysis to individual testing of electrical appliances and facilities equipment.

\*For further information and specifications, please refer to page 15.

at 100ADC input, when measuring a 10mm diameter wire

### Measure the primary and secondary sides of inverters

(Performance evaluation of motors and inverters)

#### Accurately and easily measure the power of inverters and motors for a wide range of applications, from research and development to field tests

#### Advantages

- 1. Isolated input of voltage and current lets you measure the power on the primary and secondary sides of inverters simultaneously.
- 2. Using a non-invasive current sensor makes the connection simple and easy. A vector diagram display ensures connections are checked.

#### Proprietary HIOKI Technology

- 3. Accurately measure the fundamental wave voltage and current values related to the motor axis output with confidence
- 4. All data is measured simultaneously and updated every 50 ms.

5. In addition to the harmonic analysis required to evaluate the inverter control, noise components can also be measured at the same time - ideal for determining the leakage of inverter noise

6. Use of a current sensor reduces the effect of in-phase noise from inverters when measuring the power

#### 2 PC measurements and synchronizing multiple devices

Dedicated application software allows you to perform PC measurements right out of the box

LAN and USB compatibility facilitates efficient data collection and remote operation. Bundled application software allows you to control up to 4 units.

• Acquire all data even when multi-unit measurements are performed Two units can be connected using the CONNECTION CABLE 9683 (option) to synchronize the internal clocks and control signals.

Interval measurements with the two units allow the acquisition of perfectly synchronized data, making it easy to collect completely harmonized data with a CF card without using a PC.

#### What's so special about inverter motors?

Inverter motors are indispensable as the power source of industrial equipment. The rotation of an induction motor depends on the input frequency, so if this input frequency can be made variable, the rotation can be controlled freely. Development of a frequency conversion technology called an inverter has made it possible to freely control the rotation of motors.

In recent years, the mainstream inverter control method is the PWM (Pulse-width Modulation) method.

#### • What is the PWM method?

A pseudo sinusoidal waveform (fundamental wave) resulting from the conversion of the fundamental wave frequency that determines the rotation of a motor to a pulse train called a carrier frequency (at about several kHz to 15 kHz) is effected, controlling the number of rotations.

#### • Performance evaluation and electrical measurement of motor

The axis output of a motor is closely related to the fundamental wave frequency to be input, so an accurate measurement of this fundamental wave component is required to evaluate the input characteristics.

#### • Conventional measurement method

Traditional methods use the average rectified RMS indication (Mean) in order to obtain a component value close to the fundamental wave frequency from a pseudo sinusoidal waveform (fundamental wave + carrier wave) to be input. To measure an accurate fundamental component, frequency analysis was required; however, the conventional processing method was not practical because it could barely perform real-time measurements with FFT as a result of the limited computing power.

• The 3390 is capable of measuring the fundamental wave component accurately. The 3390 performs this frequency analysis using high-speed harmonic computation processing at an interval of 50 ms and displays the true fundamental wave component. · Parameters critical to the measurement of motor inputs (outputs on the secondary side of inverters) can be measured and displayed simultaneousl

<b>Display item</b>	Measurement details
rms value	RMS value of fundamental wave + carrier wave components
mn value	RMS value (mean value) close to the fundamental wave component
fnd value	True fundamental wave component
thd value	Displays the distortion factor of measured waveform
unb value	Displays the balance between phases
±pk value	Maximum positive/negative values of waveform that is being measured
dc value	Displays a DC component harmful to the motor
ac value	RMS value obtained by removing the DC component from the RMS value
f value	Frequency of each phase

#### 4 Clearly display efficiency and loss of inverters

· Efficiency and loss measurement function built-in

The operating efficiency and power loss of an inverter can be displayed when measuring the inputs and outputs of the inverter simultaneously.

#### 6 Harmonic measurement indispensable for inverter evaluation

 4-channel simultaneous harmonic analysis function built-in (Performed simultaneously with power measurement)

Harmonic analysis is essential for the development and evaluation of inverters Synchronized to the fundamental wave frequency from 0.5 Hz to 5 kHz Harmonic analysis up to the 100th order can be performed simultaneously with

power measurement.

#### 7 Evaluate of the troublesome noise of inverters

Noise measurement function built-in (1-channel measurement: Performed simultaneously with power measurement and harmonic analysis)

Noise components at up to 100 kHz can be read while looking at the measured waveforms Simultaneously display the top 10 point frequency and voltage/current levels

A filter function is used to remove the carrier frequency components from the inverter,

### <sup>3</sup> Geared for the latest motor evaluation and analysis of Hybrid Electric Vehicles, Electric Vehicles and the like

Drive the research and development of three-phase inverter motors with high accuracy and high-speed measurements

#### **Advantages**

- 1. Use of the MOTOR TESTING OPTION 9791 (9793) lets you perform a total evaluation of inverter motors
- 2. The voltage, torque, rotation, frequency, slip, and motor power required for motor analysis can be measured with one unit
- 3. Current sensors make the connection simple. In addition, use of the AC/DC CURRENT SENSOR enables measurements with superior accuracy

#### Proprietary HIOKI Technology

4. All data is measured simultaneously and updated every 50 ms. Data collection and characteristics tests can be performed at the industry's fastest speed

5. Evolution of electrical angle measurements critical to motor analysis has made it possible to perform more accurate measurements using an incremental encoder

6. Harmonic analysis at 0.5 Hz to 5 kHz without the need for an external timing mechanism

7. Built-in digital anti-aliasing filter (AAF) lets you measure the broadband power on the secondary side of inverters to make accurate harmonic analyses

#### Evaluate high-performance vector control inverters:

 Measurements of fundamental wave voltage and current and their phases based on an accurate harmonic analysis are indispensable to motor analysis

#### Support of an incremental encoder allows detecting synchronization signals from a motor easily and accurately

Electrical angle measurements are indispensable for dynamic characteristics analysis of motors. The 3390 can conduct FFT analyses synchronized to rotation pulses from the tachometer and the motor induced voltage, and the A-phase and Z-phase pulse inputs that allow measuring and detecting the origin of the motor more simply and accurately – fully meeting the needs of the latest motor analysis tests.

#### The importance of measuring the electrical angle of synchronous motors

The key to the performance of high-performance low-fuel consumption vehicles represented by HEV and EV is the synchronous motor that is used as the power source. The synchronous motor is finely controlled by alternating signals generated by an inverter device (DC to AC conversion) using the electricity from batteries.

#### • What is a synchronous motor?

A synchronous motor rotates in synchronization with the AC frequency. Structurally, the motor is turned by the rotating force at the magnetic pole of the rotator (rotator magnetic pole), which is generated by the rotating magnetic field generated by applying an alternating current to the magnetic field (stator magnetic pole). The rotation speed is synchronized to the speed of the rotating magnetic field, so the

#### Application 1: "Electrical angle measurement"

 $\circ$  The voltage / current fundamental wave component " $\theta$ " from the machine angle origin can be calculated by performing harmonic analysis of motor input voltage / current by synchronizing to the A-phase signal and z-phase signal of an encoder.

 A function to perform zero compensation for this phase angle when a motor induced voltage is generated can be used to measure the voltage and current phase (electrical angle) in real time based on the induced voltage when the motor is started.

speed can be controlled by changing the speed of the rotating magnetic field (power supply frequency). In addition, high operating efficiency is one of the advantages of the synchronous motor.

#### • Why is electrical angle measurement necessary?

In the case of a synchronous motor, a phase shifting occurs between the stator magnetic pole and the rotator magnetic pole due to a change in the load torque. This shifted angle and the torque force that can be generated by a motor have a close relationship, so it is important to understand this shifted angle (electrical angle) in order to achieve high-efficiency motor control.

#### • The **3390** provides a more accurate measurement method

The **3390** supports the incremental encoder output in addition to the measurement methods of the HIOKI **3194** Power HiTESTER – enabling you to measure this electrical angle more easily and accurately.

#### **2** Analyze harmonic signals from the low-speed rotation range of motors

• Harmonic analysis from a synchronization frequency of 0.5 Hz Accurate measurements can be performed in the low-speed rotation range of motors without the need of an external clock.

If the synchronization frequency is 45 Hz or more, analysis results are updated every 50 ms, so data analysis can be performed in real time.

Synchronization frequency range	Window wave number	Analysis order	
0.5Hz to 40Hz	1	100th order	
40Hz to 80Hz	1	100th order	
80Hz to 160Hz	2	80th order	
160Hz to 320Hz	4	40th order	
320Hz to 640Hz	8	20th order	
640Hz to 1.2kHz	16	10th order	
1.2kHz to 2.5kHz	32	5th order	
2.5kHz to 5.0kHz	64	3rd order	

#### **3** Vector display of electrical angles of motors

• Display vectors including that of the phase angle and electrical angle  $(\varDelta \theta)$  of fundamental wave voltage and current. The measured data can be used as parameters to calculate the Ld and Lg values.

#### **5** X-Y graph display lets you check the dynamic characteristics of inverters

• X-Y graph display function built-in (X-axis: 1 item, Y-axis: 2 items) By simply setting 2 items to the Y-axis as with a 6-axis graph used to evaluate motors, you can display the characteristics of a motor and similar devices in real time.

# 6 Simultaneously measure temperature that is indispensable for motor evaluation

 Connect the HIOKI 3440 Series Temperature HiTESTER to measure changes in the motor temperature and acquire data as parameters for motor evaluation

Connect the HIOKI **3440** Series Temperature HITESTER to the **3390** (via the RS-232C interface) to acquire data while displaying the temperature.

#### Application 2: Electrical angle measurement using induced voltage of motors (The same measurements conducted with the HIOKI 3194 can also be performed)

Correct the rotation synchronization signal and induced voltage phase of motors as well as measure the phase of voltage and current for the induced voltage of a running motor as an electrical angle.

Step 1: Turn the motor from the load side, and measure the induced voltage of the motor

· Frequency divider circuit (up to 1/60000 frequency dividing) - helpful when the rotation synchronization

Δ-to-Y conversation function - convert the line voltage to a phase voltage (virtual neutral reference) when

signal consists of multiple pulses for one cycle of induced voltage.

three-phase three-wire (3P3W3M connection) measurements are performed.

Other Advance Functionsmotor

 Measure the fundamental wave's RMS value and the total RMS value of the induced voltage.
 Perform zero compensation for the phase between the rotation synchronization signal and the fundamental wave voltage of the induced voltage.

#### Step 2: Measurement of a running motor

 Measure the fundamental wave component, harmonic component, and electrical angle of line voltage and current of a line to the motor. (The measured data can also be used as parameters for calculation of Lp/Lq)
 Simultaneously measure motor efficiency, inverter efficiency, total efficiency, and inverter loss while observing the motor control.

### Evaluate new energies such as solar power, wind power, and fuel cells

Assess power conditioners that are indispensable for converting new energies to electrical power

#### **Advantages**

- 1. The input and output characteristics of a power conditioner can be measured simultaneously in combination with an AC/DC current sensor
- 2. Use of a current sensor makes the connection simple. Make accurate measurements in combination with the AC/DC CURRENT SENSOR
- 3. The sale and purchase of electrical energy of a power line connected to a power conditioner can also be measured with one unit

#### Proprietary HIOKI Technology

4. Measure DC mode integration, which responds quickly to changes in the input of sunlight and the like, and RMS mode integration, which handles the separate integration of the sale and purchase of electric energy, all at the same time

5. Ripple factor, efficiency and loss, which are required to evaluate power conditioners for solar power generation, can be measured with one single unit.

#### Conditioner-specific measurement items all measurable

 Power conditioner measurement-specific ripple factor and disequilibrium factor can also be measured and displayed simultaneously (up to 32 items can be displayed simultaneously), resulting in enhanced test efficiency

Display item	Measurement item
rms value	RMS (DC/AC voltage/current of input and output)
P, Q, S, $\lambda$ values	Active power, reactive power, apparent power, power factor
Loss value	Input and output loss
η value	Efficiency
thd value	Distortion factor (voltage/current)
rf value	Ripple factor (for DC)
unb value	Disequilibrium
f value	Output frequency

#### Current trends in solar power generation

• Interconnected system of solar power generation and power conditioner Electrical energy generated from the solar power generation is DC electrical energy, so it needs to be converted to AC electrical energy to be used by connecting to the utility grid. The device to convert direct current to alternating current is the power conditioner. In particular, to sell electrical energy by connecting to the utility grid, the performance of the power conditioner is important, so the method to evaluate the performance is specified by the national standards.

#### IEC standard

IEC 61683:1999, Photovoltaic systems -Power conditioners- Procedure for measuring efficiency

#### Evaluation and measurement of power conditioners

The IEC standard stipulates detailed measurement items to evaluate the input and output characteristics of power conditioners such as harmonic level, ripple factor, voltage disequilibrium factor, and voltage/current waveform.

• The **3390** supports a long list of measurement items including the specific ones required.

The  $\ensuremath{\textbf{3390}}$  can measure ripple factor and evaluate and analyze through simultaneous measurements.

# 2 The efficiency (loss) and the amount of electrical energy sold and purchased can be displayed clearly

• Not only the amount of electricity generated with solar cells and the efficiency (loss) of a conditioner but also the amount of electrical energy sold and purchased by connecting to the utility grid can be measured simultaneously with one single unit

#### 4 Accurately measure harmonics that are important for

#### connecting to the utility grid

• The harmonic component and distortion factor important for connecting a power conditioner to the utility grid can be measured simultaneously.

Synchronized to the fundamental frequency of 0.5 Hz to 5 kHz.

Analyze up to the 100th order of voltage, current, and voltage harmonic, and display the current direction

### **3** Check the input and output waveforms of a conditioner

• Simultaneously check the input and output waveforms of a conditioner at 500 kS/s The input and output waveforms required to evaluate power conditioners can be checked simultaneously with one unit.

### 5 Also measure the noise flow of a connected utility grid

Noise measurement function (1-channel measurement: Performed simultaneously with power measurement and harmonic analysis)

Noise components at up to 100 kHz can be read while looking at the measured waveforms Frequency and voltage/current levels for the top 10 points can be displayed simultaneously.

#### Bundled software dedicated to the 3390 (free download from the HIOKI website)

#### Features

- Connect the 3390 to a PC via LAN or USB for completely remote operation
- Save measured data to the PC in real time (interval saving is also available)
- Download data stored in the USB memory or CF card
- Connect up to four 3390 Power Analyzers using the free software for remote operation and simultaneous data collection

Motor screen	Displays the measured values of the MOTOR TESTING OPTION 9791 (9793). Display pattern: Displays the numerical values of 4 items			
3. Data save Auto data save	Saves each measured value to the CF card at each interval			
Save destination				
Save itemAuto				
Data format	CSV file format			
Manual data Save	Saves each measured value to each save destination when the SAVE key is presse			
	USB memory / CF card, the save destination folder can be specified			
	Any item can be selected from all measured data, including harmonic value and peak value of the noise measurement function			
Data format				
Screen hard copy Save destination	Saves the display screen to the save destination when the COPY key is pressed USB memory / CF card			
Data format	* The save destination folder can be specified when USB memory or CF card is specifie			
Setting data save	Setting information can be saved and loaded to and from the sav destination as a setting file			
	(With the exception of language setting and communication setting)			
	USB memory / CF card (the save destination folder can be specified)			
	nected equipment			
Synchronized measurement	The <b>3390</b> master and <b>3390</b> slaves can be connected with synchronization cables to perform synchronized measurements * If the interval setting is identical, synchronized measurements can be			
	saved automatically			
Synchronized item	Clock, data update rate (excl. noise measurement), integration start/stop data reset, event			
Event item	, , , , , , , , , , , , , , , , , , , ,			
Synchronization timing	Clock, data update rate, start/stop, data reset, event (During operation of the master by the key or via communication)			
Synchronization delay	Up to 5 µs per connection, up to +50 ms per event			
Temperature measurement	Acquires the measured temperature values from the thermometer connecte			
Applicable thermometer	to the RS-232C interface			
Number of channels	HIOKI thermometers capable of communication via RS-232C 1 channel			
5. System				
Display language	English / Japanese / Chinese			
Clock function	Auto Calendar, Auto Leap Year Adjustment, 24 Hour Meter			
Clock setting	Year, Month, Day, Hour, Minute Setting, Zero Second Adjustment			
Real time accuracy	Within ±3 s / day (25°C)			
Beep tone	OFF / ON			
Screen color	COLOR1 / COLOR2 / COLOR3 / COLOR4 / MONO			
Start screen select	Connection screen / screen closed in the previous session (Measurement screen only ON / 1min / 5min / 10min / 30min / 60min			
Sensor recognition	Automatically recognizes the current sensor connected			
Alarm display	Voltage/current peak over threshold detection, synchronization source nor			
Kaulaak	detection (Alarm mark on)			
Key lock System reset	ESC key: ON/OFF by holding down the key for 3 seconds (Key lock mark on) Sets the equipment to the default (factory) settings (Communication setting			
System reset	are not changed)			
File manipulation	Media data list display, media formatting, new folder creation, folder fil deletion, file copy between media			
	detenoir, me copy between media			
General spe	cifications			
Operating location	Indoors, altitude up to 2000 m, contamination class 2			
Storage temperature and humidity ranges	-10°C to 50°C, 80%RH or less (No dew condensation)			
Operating temperature and humidity ranges	0°C to 40°C, 80%RH or less (No dew condensation)

Voltage and current alternating-current component						
Voltage and current mean value	$Xdc(i) = \frac{1}{M} \sum_{i=0}^{M^{-1}} X_{0:i}$					
Voltage and current fundamental wave component	Fundamental wave value X1(i) based on the harmonic calculation result					
Voltage and current peak value	Maximum value among X pk+(i) = X (i)s M Minimum value among X pk-(i) = X (i)s M					
Active power	$\begin{split} P(i) = \\ \frac{1}{M} \sum_{s=0}^{M^{-1}} & \left( U_{(i)s} \times I_{(i)s} \right) \end{split}$	P12 =P1+P2 P34 =P3+P4		P123 =P1+P2+P3		
	<ul> <li>In the cases of 3P3W3M and 3P4W connections, phase voltage is used for the voltage waveform U (i)s.</li> <li>(3P3W3M: U1s = (U1s-U3s)/3, U2s = (U2s-U1s)/3, U3s = (U3s-U2s)/3)</li> <li>The polarity symbols of active power is findicate the power direction when power is consumed (+P) and when power is regenerated (-P)</li> </ul>					
Apparent power	S(i) =U(i)×I(i)	S12 =S1+S2 S34 =S3+S4	$S_{12} = \frac{\sqrt{3}}{2} (S_1 + S_2)$ $S_{34} = \frac{\sqrt{3}}{2} (S_3 + S_4)$	\$123 =\$	1+ <b>S</b> 2+ <b>S</b> 3	
	Selects rms or mn for U(i) and I(i)     In the cases of 3P3W3M and 3P4W connections, phase voltage is used for the voltage U (i)					
	$Q(i) = si_{(i)}\sqrt{S_{(i)}^2 - P_{(i)}^2}$	Q12 =Q1+Q2 Q34 =Q3+Q2		Q123 =Q	1+Q2+Q3	
Reactive power	The polarity symbol si of reactive power Q indicates symbol [none]: lng and symbol [-]: lead.     The polarity symbol si(i) is determined by lng or lead of voltage waveform U (i)s and current waveform I (i)s for each measurement channel (i), and in the cases of 3P3W3M and 3P4W connections, phase voltage is used for the voltage waveform U (i)s.					
Power factor	1~01	1	$\lambda_{34} = si_{34} \frac{P_{34}}{S_{34}}$		$\frac{P_{123}}{S_{123}}$	
	<ul> <li>The polarity symbol si of power factor \u03c5 indicates symbol [none]: lag and symbol [-1; lead.</li> <li>The polarity symbol si(i) is determined by lead or lag of volarge awardsrm U (i)s and current waveform I (i)s and current waveform I (i)s and si12, si34, and si123 are determined by the symbol of Q12, Q24, and Q123, respectively.</li> </ul>					

Connection Item	1P2W	1P3W	3P3W2M	3P3W3M	3P4W	
Phase angle		$\phi_{12} = si_{12}$ $\phi_{34} = si_{34}$	· ·	$\phi_{123} = si_{123}cos^{-1} \lambda_{123} $		
	The polarity symbol si(i) is determined by lead or lag of voltage waveform U (i)s and current waveform I (i)s for each measurement channel. si12, si34, and si123 are determined by the symbol of Q12, Q34, and Q123, respectively.					
(i): Measurement channel, M: Number of samples between synchronization timings, s: Sample point number						

Motor analysis calculation algorithm					
Item	Setting unit	Calculation algorithm			
chA	V (DV voltage)	$\frac{1}{M}\sum_{s=0}^{M-1}A_s$			
	N• m / mN• m / kN• m	When analog DC	A [V] × chA scaling setpoint		
	common (torque)	When frequency	(Measurement frequency - fc setpoint) × rated torque setpoint / fd setpoint		
	M: Number of samples between synchronization timings, s: Sample point number				
chB	V (DC voltage)	$\frac{1}{M}\sum_{s=0}^{M-1} B_s$			
	Hz (frequency)	When analog DC	B[V] × chB scaling setpoint		
		When pulse input	Pole number setpoint x pulse frequency / 2 × pulse number setpoint		
	r/min (rotation)	When analog DC	B[V] × chB scaling setpoint		
		When pulse inpu <b>t</b>	$2 \times 60 \times$ frequency [Hz] / pole number setpoint		
	N• m (unit of chA)	(Indicated value of chA) × 2 × $\pi$ × (indicated value of chB) / 60			
	mN• m (unit of chA)	(Indicated value of chA) ×2 × $\pi$ × (indicated value of chB) / 60 / 1000			
Pm	kN• m (unit of chA)	(Indicated value of chA) $\times 2 \times \pi \times$ (indicated value of chB) $\times 1000 / 60$			
	Calculation cannot be performed when the unit of chA is other than the above, or the unit of chB is other than r/min.				
Slip	Hz (unit of chB)	100 × input frequency - indicated value of chB / input frequency			
	r/min (unit of chB)	$100 \times 2 \times 60 \times \text{input frequency} - \text{indicated value of chB} \times \text{pole}$ number setpoint / 2 × $\pi$ × input frequency			
	Selects the input frequency from f1 to f4				

#### **Current sensors specifications** (Accuracy guarantee period of 1 year with the exception of the 9709 for 6 months) Model 9272-10 9277 9278 9279 (Non-CE mark product) Rated current AC 20A/200A AC/DC 20A AC/DC 200A AC/DC 500A Maximum continuous input range 50A/300A rms 50A rms 350A rms 650A rms Accuracy $\pm 0.5\%$ rdg. $\pm 0.05\%$ f.s., $\pm 0.2^{\circ}$ (45 to 66 Hz, DC: DC ±0.3%rdg.±0.01%f.s., ±0.2° (30 minutes after power is turned on and after magnetization) compatible sensor) DC to 1kHz: $\pm 1.0\%$ ( $\pm 0.5^\circ)$ 1Hz to 5Hz: ±2%rdg.±0.1%f.s. Frequency characteristic 1 k to 10 kHz: ±2.5 % (±2.5°) 1kHz to 5kHz: ±1%rdg.±0.05%f.s. (±1.0) 10kHz to 50kHz: ±5%rdg.±0.1%f.s. 1 k to 50 kHz: ±2.5 % (±2.5°) 50 k to 100 kHz: ±5.0 % (±5.0°) 10 k to 20 kHz: ±5.0 % (±5.0°) Note ±0.2%rdg. or less ±1.5%rdg. or less Effect of ±0.2%rdg. or less ±1.5%rdg. or less (at 100A/55Hz input, using with the wire 10mm conductor position (DC,55Hz) (DC,55Hz) (DC,55Hz) diameter) Max. 0.2A 100mA or less Max. 1A Max. 2A Operating temperature and humidity (in an AC electromagnetic field of 400 A/m, 60Hz) (400 A/m, 55Hz and DC) (400 A/m, 55Hz and DC) (400 A/m, 55Hz and DC) Operating temperature and humidity 0°C to 50°C (-32°F to 122°F) 0°C to 40°C (-32°F to 104°F) 80%RH or less (No condensation) 80%RH or less (No condensation) Measurable φ 46mm (1.81") φ 20mm (0.79") φ 40mm (1.57") conductor diameter Dimensions/weight 78Wx188Hx35Dmm(3.07\*Wx7.40\*Hx1.38\*D), 430g(15.2 oz.) 176Wx69Hx27Dmm(6.93\*Wx2.72\*Hx1.06\*D), 470g(16.6 oz.) 220Wx103Hx43.5Dmm(8.66\*Wx4.06\*Hx1.71\*D), 470g(16.6 oz.) 176Wx69Hx27Dmm(6.93\*Wx2.72\*Hx1.06\*D), 470g(16.6 oz.) 176Wx69Hx27Dmm(6.93\*Wx20\*Hx1.06\*D), 470Wx69Hx20\*Hx1.06\*D), 470Wx69Hx20\*Hx1.06\*D), 470Wx720\*Hx1.06\*D), 470Wx720\*Hx1.06 Model CT6862 CT6863 9709 CT6865

Rated current	AC/DC 50A AC/DC 200A		AC/DC 500A	AC/DC 1000A		
Maximum continuous input range	100A rms 400Arms		700A rms	1200A rms		
Accuracy (45 to 66 Hz, DC: DC compatible sensor)	±0.05 %rdg.±0.01 % f.s. , ±0.2° (Right after power is turned on at DC and 16Hz to 400Hz)		$\pm 0.05~\% rdg.\pm 0.01~\%~f.s.$ , $\pm 0.2^{\circ}$ (10 minutes after power is turned on)	$\pm 0.05~\% rdg. \pm 0.01~\%~f.s.$ , $\pm 0.2^{\circ}$		
Frequency characteristic	DC to 16 Hz: ±0.1%rdg.±0.02%f.s.(±0.3°)           5kHz to 10kHz: ±1%rdg.±0.02%f.s. (±1.0°)           500kHz to 1M Hz: ±30%rdg.±0.05%f.s. (±0.3°)           300kHz to 500k Hz: ±30%rdg.±0.05%f.s. (±0.3°)		DC to 45Hz: ±0.2%rdg.±0.02%f.s.(±0.3°) 5kHz to 10kHz: ±2%rdg.±0.1%f.s. (±2.0°) 20kHz to 100kHz: ±30%rdg.±0.1%f.s. (±30°)	DC to 16Hz: ±0.1%rdg.±0.02%f.s.(±0.3°) 500Hz to 10kHz: ±5%rdg.±0.05%f.s. 10kHz to 20kHz: ±30%rdg.±0.1%f.s.		
Effect to conductor position	±0.01%rdg. or less (50A input, DC to 100Hz, using with the wire 5mm diameter)	±0.01%rdg. or less (100A input, DC to 100Hz, using with the wire 10mm diameter)	±0.05%rdg. or less (at 100ADC input, using with the wire 10mm diameter)	±0.05%rdg. or less (1000A input, 50/60Hz, using with the wire 20mm diameter)		
Effect of external	10mA or less	50mA or less	50mA or less	200mA or less		
electromagnetic field	Scaled value, in a DC or 60Hz magnetic field of 400 A/m					
Operating temperature and humidity	CT6862/CT6863/CT6965: -30°C to 85°C (-22°F to 185°F), 9709: 0°C to 50°C (-32°F to 122°F) 80%RH or less (No condensation)					
Measurable conductor diameter	φ 24mm (0.94")	φ 24mm (0.94")	φ 36mm (1.42")	φ 36mm(1.42")		
Dimensions/weight	70W×100H×53Dmm (2.76"W×3.94"H×2.09"D), CT6862: 340g(12.0 oz.), CT6863: 350g(12.3oz.)		160W×112H×50Dmm (6.30"W×4.41"H×1.97"D), 9709: 850g(30.0oz.) CT9895: 1000g(35.3oz)
