EOS 7980F Series

Solutions for Multi-Wavelength Test Applications

Dependable long-term performance is the trademark of the FOS-7980 Series Fiber Optic Source Modules, even in the most exacting laboratory and production environments. Together with the FOM-7900B Modular Fiber Optic System, they deliver the most effective multi-wavelength test solution for both active and passive WDM components and systems.

WDM DFB Fiber Optic Source Modules

Coherence control of narrow linewidth sources will minimize instabilities caused by reflections in single mode fiber.

Standard features include dual stage temperature control, ILX's proprietary low noise laser current control technology, closed loop constant power operation and redundant current limits. The FOS-7980F Series Source Modules provide the performance and reliability required for your most demanding fiber optic testing needs.

Sophisticated Module Control

Each FOS-7980F module can be controlled independently through an intuitive menu on the FOM-7900B System mainframe front panel, or remotely through RS-232 or GPIB IEEE-488.2. Easy-to-understand commands allow full control of wavelength, output power, calibration, and modulation functions. Banked remote capability provides control of up to two hundred source channels from a single GPIB address.

The FOS-7980F modules save time by allowing quick and easy configuration of each application. For example, all modules can be controlled by one "Channel All" function.

Coherence Control for a Stable Test System

In narrow linewidth fiber optic test systems, reflections from connectors and the effects of etalons can degrade source stability and cause measurement instability. In higher power applications, Stimulated Brillouin Scattering worsens this problem by providing narrow-band gain for light traveling back to the source. For these reasons, controlling DFB source spectral linewidth is critical.

Coherence control of the FOS-79800F modules broadens laser linewidth from 30 MHz to 1 GHz. This reduces spectral power density and decreases coherence length from several meters to around 20 cm. The final result is remarkably stable sources for solid measurements.

Synchronous 100% Modulation for EDFA Test

The FOS-79800F modules feature a processor-controlled modulation mode that supplies 100% depth, 50% duty cycle modulation drive current. All active modules can be modulated synchronously at any frequency from 1–500 kHz. This is ideal for measuring EDFA spontaneous emission background level by the time domain extinction testing method.

Precise control of laser diode temperature and current densities ensures a stable wavelength.

Normal and inverted TTL-level outputs provide flexible triggering for data acquisition instruments, simplifying test setup. In addition, a rear panel modulation input synchronizes multiple mainframes, and allows synchronization of the system with an external instrument.

WDM DFB
Fiber Optic
Source Modules

The perfect fiber optic source solution, now with picometer resolution and extended wavelengths.

Calibrated Attenuation for Accurate Channel Equalization

For gain flatness testing with accurate attenuator-like performance, the FOS-7980F modules feature high resolution attenuation so you can easily equalize channel levels. Attenuation is accurate within ± 0.1 dB while maintaining other specifications from maximum power to 5 dB down. If speed is critical to your application, the available SS-810 source shutter blocks the output of the modules without turning off the current to the lasers. This significantly reduces time spent waiting for the output to settle.

Introduced in 1996, the FOM-7900 Fiber Optic Test System with Modular Sources was built on our laser diode control experience, bringing the first modular source system to EDFA manufacturers. This third generation platform will bring unparalleled experience and reliability to your test system.

We Understand That Component Testing Throughput is Critical

Ask us about edge testing and other innovative solutions for testing your passive components. If you have special requirements such as higher power, special selected wavelengths, or customization with your lasers, call us. Our technically qualified sales engineers can help you define the custom fiber optic source configuration for your testing needs.

Industry leading fiber optic source power attenuation accuracy.

Reliability Built on Industry Leading Experience

For over 15 years ILX Lightwave has worked closely with laser diode manufacturers developing instrumentation and providing solutions.

FOS-7980F Fiber Optic Source short term stability is ± 0.005 dB.

Maximum output power range 9–20 mW

Output power stability <0.005 dB rms

Output wavelength stability ±3 pm

Coherence control for SBS suppression and power stability

For your most demanding WDM system and component test applications, ILX Lightwave proudly offers the FOS-7980F Series WDM DFB Fiber Optic Source Modules. This fourth generation source module platform brings unparalleled reliability to your test systems. Choose maximum calibrated power levels, from 9–20 mW. Select center wavelengths from 1475–1625 nm on ITU grid points or at your custom specification. These modules offer an impressive list of features: picometer resolution, high power, exceptional stability, coherence control, optional source shutter, optional PM alignment and accurate attenuation.

When installed in the FOM-7900B Fiber Optic System Mainframe, FOS-7980F Series WDM DFB Fiber Optic Source Modules are easily controlled through simple front panel menu entries, or through a full featured GPIB remote interface. Mainframe trigger capabilities allow you to easily synchronize output modulation of multiple modules.
