Notes:

1. Specifications apply to displayed value. 4-wire connections, except 100 mΩ.
2. Temperature coefficient is an adder to uncertainty specifications that does not apply unless operated more than 5°C from calibration temperature, or calibrated outside the range 19°C to 24°C. Two examples:
 - a) Calibrate at 20°C: Temperature coefficient adder is not required unless operated below 15°C or above 25°C.
 - b) Calibrate at 26°C: Add 2°C temperature coefficient adder. Additional temperature coefficient adder is not required unless operated below 21°C or above 31°C.
3. Refer to current derating factors table for loads outside of this range.
4. Active two-wire compensation may be selected for values less than 100 kΩ, with either the front panel or the meter input terminals as reference plane. Active compensation is limited to 11 mA load, and to 2V burden. Two wire compensation can be used only with Ω meters that source continuous (not pulsed) dc current.

Notes:

- For $|I - I_L|$, errors occur due to thermally generated voltages within the 5700A. Use the following equation to determine the error, and add this error to the corresponding UNCERTAINTY or STABILITY specification.

$$\text{Error} = K(I_L - I)/(I_L \times I)$$

Where: Error is in mΩ for all TWO-WIRE COMP values and FOUR-WIRE SHORT, and in ppm for the remaining FOUR-WIRE values.

K is the constant from the above table;
 I and I_L are expressed in mA for SHORT to 1.9 kΩ;
 I and I_L are expressed in μA for 10 kΩ to 100 MΩ

- For $|I - I_L| < I_{L_{MAX}}$, errors occur due to self-heating of the resistors in the 5700A. Use the following equation to determine the error in ppm and add this error to the corresponding UNCERTAINTY or STABILITY specification.

$$\text{Error in ppm} = K(I^2 - I_U^2)$$

Where: K is the constant from the above table;
 I and I_U are expressed in mA for SHORT to 19 kΩ;
 I and I_U are expressed in μA for 100 kΩ to 100 MΩ

Specifications are otherwise identical for all output locations.

1. Add to uncertainty specifications:

±200 X I² ppm for >100 mA on 220 mA range
±10 X I² ppm for >1A on 2.2A range

2. Temperature coefficient is an adder to uncertainty specifications. It does not apply unless operating more than ±5°C from calibration temperature.

3. Burden voltage adder is an adder to uncertainty specifications that does not apply unless burden voltage is greater than 0.5V.

4. For higher loads, multiply uncertainty specification by:

$$1 + \frac{0.1 \times \text{actual load}}{\text{maximum load for full accuracy}}$$

5. 5700A compliance limit is 2V for outputs from 1A to 2.2A. 5725A Amplifier may be used in range-lock mode down to 0A.

Minimum output: 0 for all ranges, including 5725A.

Settling time to full accuracy: 1 second for μA and mA ranges; 3 seconds for 2.2A range; 6 seconds for 11A range; + 1 second for range or polarity change
